- **Optimized Silver Halide Crystals for Laser Exposure** - Excellent prints from Frontier system laser printers and other digital exposure systems.
- **Consistent High-Quality Print Output** - *Advanced Photoelectron Controlling Technology* delivers consistently ultra high-quality prints with rich gradation from highlights to shadows.
- **Even Higher Level of Image Stability** - New *Hybrid Dye-image Stabilizing Technology* enhances the fidelity of the anti-fading agent of Fujicolor Crystal Archive emulsions to provide even longer print permanence.
- **Brilliant Whites** - *Whiteness Enhancing Technology* produces more brilliant whites as well as clearer, more detailed highlights. *Anti-fogging Technology* results in lasting brilliant whites. Together, brilliant whites and clean highlight details are consistently attained.
- **Consistent Processing Quality** - *Process Stabilizing Technology* provides consistent quality under various processing conditions, such as seasonal periods of lowered processing solution activity. This new technology also improves latent image stability.

Introducing our newest digital color paper—Fujicolor Crystal Archive Paper Type One. This paper has been further optimized for use with digital printers. Building on successful Crystal Archive Paper technologies, newly developed advancements provide brilliant color and pure clean whites. The result is magnificent prints with rich tonal gradation, crisp detail and lifelike texture, especially when used with the Fujifilm Frontier Digital Lab System.

This RA-4 compatible digital paper is easy to use in the lab, designed to resist pressure and scratches. Improved Crystal Archive image stability assures your color photographs will withstand the test of time with unparalleled print permanence. Together with your investment in the latest digital printing technology, Fujicolor Crystal Archive Paper Type One will deliver the consistency and performance your customers expect from your laboratory.
